

Press Release

Git client Tower now with Touch Bar integration & extended Git LFS support

The brand new update to the Mac version of the popular developer tool comes with new pro features, speed improvements and support for Apple's Touch Bar.

Berlin, Germany - January 31st, 2017. Today, fournova announces the release of [Tower for Mac](#) 2.6. The free update brings another round of great features and improvements to the popular Git client.

New features include:

- **Touch Bar Support:** Owners of Apple's latest Macbook Pro can now make use of Tower's own Touch Bar integration. The Touch Bar adapts to the usage of Tower and offers context-specific commands with a single touch. Fetch, pull, push, and other handy workflows have never been so convenient in Tower.
- **Extended Git LFS Support:** Git Large File Storage (LFS) offers an improved way to integrate large binary files (e.g. graphics, videos, and audio samples) into the Git workflow. While working with Git LFS has already been possible in Tower, the update brings extended support. Tower now offers initial configuration and many advanced features and settings for Git LFS.
- **Speed Improvements:** The new version comes with a lot of improvements to Tower's performance. Significant speed improvements make the Git client even faster and more responsive than before.
- **Easier OAuth Management:** With many code hosting services authentication via OAuth can be cumbersome. Tower now provides its own helper service that simplifies OAuth, offering its users a much smoother experience.

These are just a few of the many improvements that ship with the new version. The full list of new features, improvements, and fixes is available [here](#).

In addition to the new Mac version fournova also shipped version 1.0.3 for Tower for Windows. This is the third update since the launch of the Windows version in November and brings a long list of improvements and fixes to the app. The release notes are available [here](#).

Both new versions come as a free update for existing customers. New users can test the app and all its features 30 days for free. Licenses are available for \$79. Volume discounts and discounts for students and educational institutions are offered as well.

For more information about Tower - including a screencast and screenshots - a compact press kit is available at www.git-tower.com/about/press.

About fournova:

fournova is an independent software company from Germany. Founded in 2010 fournova develops Mac and Windows apps such as the popular Git client Tower, which helps over 80,000 customers from startups to Fortune 100 companies to easily and productively work with the Git version control system.
