Press Release

Git client Tower now lets you handle Git via drag and drop on Windows

The free update brings a big boost to performance and adds another round of highly anticipated features to the Windows version of the popular developer tool.

Berlin, Germany - September 26th, 2017. Today, fournova announces the release of [Tower for Windows 1.2](). The native Git client is a popular tool among developers and designers. With its focus to help developers and designers use Git in a more productive and secure way, the new release is a big step forward. Various workflows can now simply be done via drag and drop.

"Besides adding important new features to the Windows client, the team focused on improving the performance in various areas of the app. And it shows. Our beta testers love the performance boost and we are excited to make version 1.2 available to all our users today" says Julian Rothkamp from fournova.

New features of the latest version include:

- **Drag & Drop:** the latest version makes working with branches, stashes and tags even easier - simply via drag and drop. Users can create, pull, and push branches, create tags, partially apply stashes and even cherry-pick commits.

- **GVFS Support:** earlier this year Microsoft announced its efforts to scale Git to very large projects and introduced the Git Virtual File System (GVFS). Rather than downloading a large repository in its entirety and check out all the files, GVFS downloads only the portions the user needs based on what she uses. GVFS is now supported in Tower.

- **Custom Git Binary:** users can now choose a custom Git Binary via Tower's preferences.

- **Patches:** users can now save and apply patch files.

- **Export Revision:** Tower now allows exporting the file tree or an archive of every commit.

- **History Changesets:** users can now show the file history and restore a modified file directly from a commit's changeset view.

These are just a few of the many improvements that ship with the new version. Learn more about today's release in our launch blog post.

The update is free for existing customers. New users can test the app and all its features 30 days for free.

Students and educational institutions receive a 50% discount.
